Production clarity.

Clearer tech packs for overseas production

Flat sketches alone couldn't show the knit texture or the pocket interior, so I added visuals for those parts and rewrote the instructions in English. The factory came back with far fewer questions.

01 Korean original
Flat sketch drawn in Illustrator

02 English version
Same sketch, instructions in English

03 Added detail
Texture and pocket interior, visualized

04 Final product
Shipped piece, flat and on model

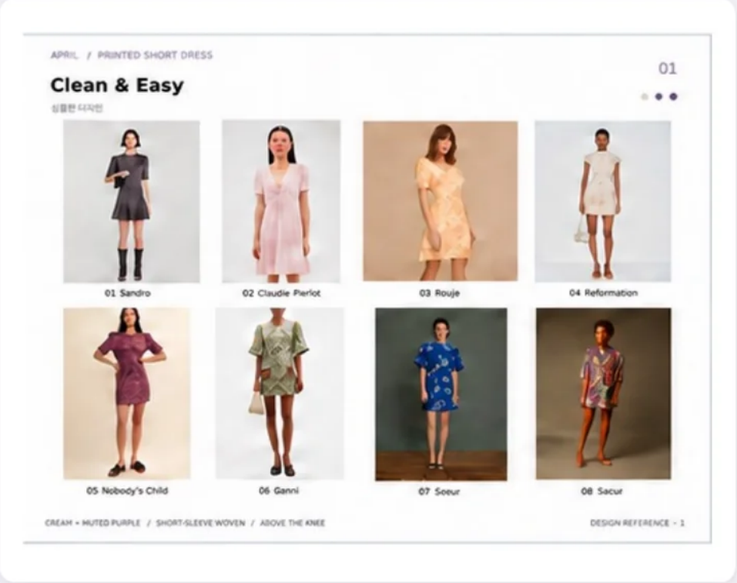

What I did
Drew the flats, set the production specs and reviewed the results.

What AI handled
Generated texture and pocket visuals from my flats, then rewrote the instructions in factory-ready English.

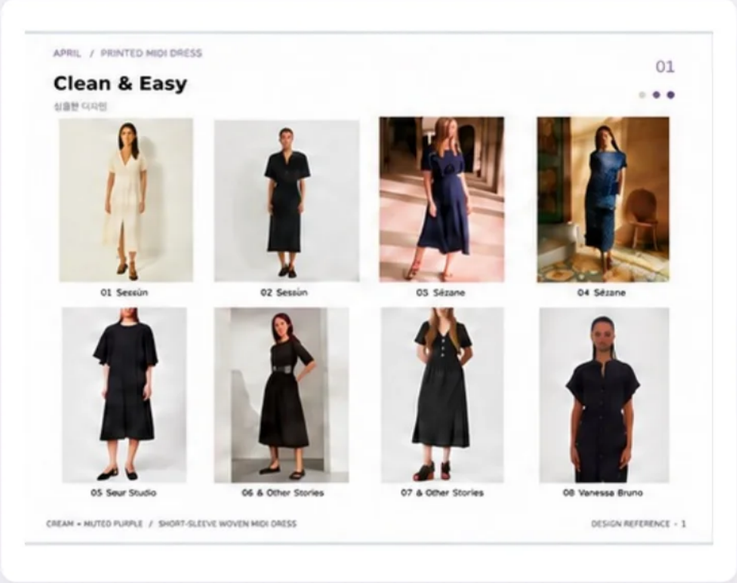

Reference research.

An agent ran the research, on my criteria

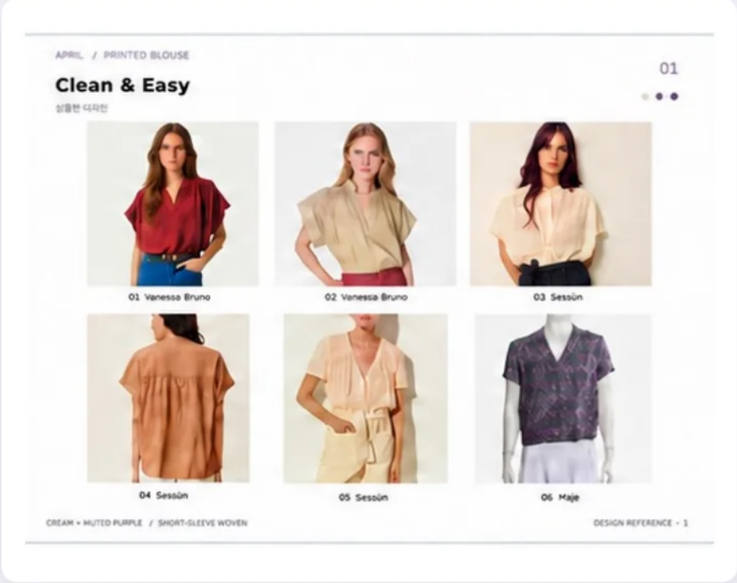

I set the mood and selection rules first, then gave them to a moodboard agent.
Starting from my past research and saved Pinterest images,
it put together a board for each category.

01 **Short dresses**

02 **Midi dresses**

03 **Blouses**

What I did
Set the criteria: Clean & Easy mood,
cream and muted purple, sleeve and length.
Then reviewed every pick.

What AI handled
With my criteria and saved images
as context, the agent searched, filtered
and laid out the boards.

Outcome
Five-page boards for each category,
used directly in design work.
Flats stay private until launch.

Initial concept.

Seeing the keyring in 3D before sampling

I turned my Illustrator drawings of a bear keyring into 3D mockups to compare shape, material feel and each outfit before any sampling.

01 First sample design
Body and outfit sets, drawn in Illustrator

02 First sample, AI mockup
Blue stripe, ivory stripe and denim dress. AI images, not real samples

What I did
Designed the body shape, outfits and colors, then reviewed the mockups.

What AI handled
Generated 3D mockups from my drawings, so all three outfits could be compared side by side.

Shape & proportion.

Fixing proportions with a mockup first

The first sample came out too long, so I mocked up a shorter version first.
Once I knew how much to take off, I briefed the second sample.

01 Design flats
Body and outfit flats

02 Revised AI mockup
Shorter body length. AI image, not a real sample

03 Final product
Second sample with the new proportions

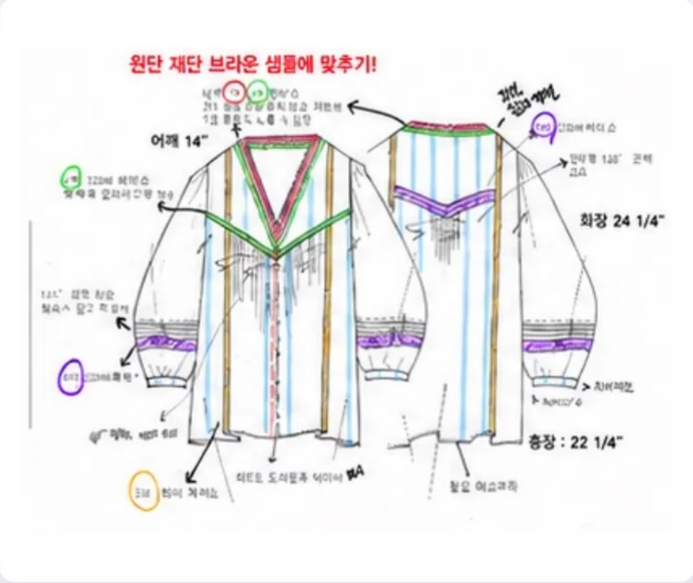

What I did
Drew the flats, reviewed the sample and set the final proportions.

What AI handled
Generated a shorter version to compare proportions without making another sample.

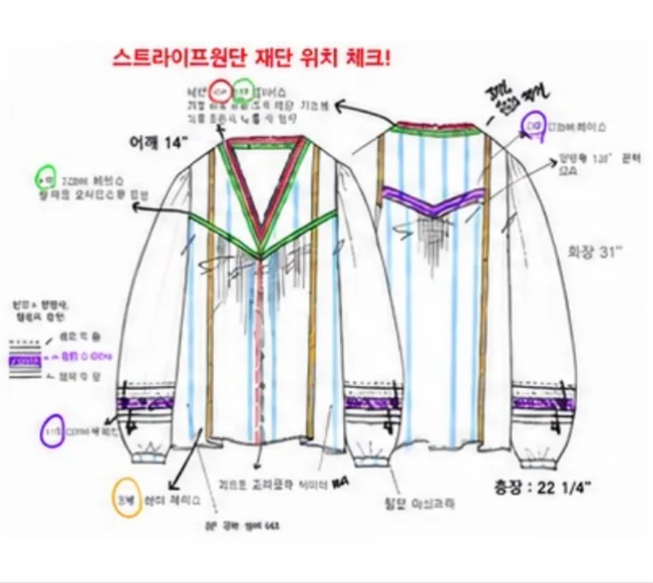

Sketch revision.

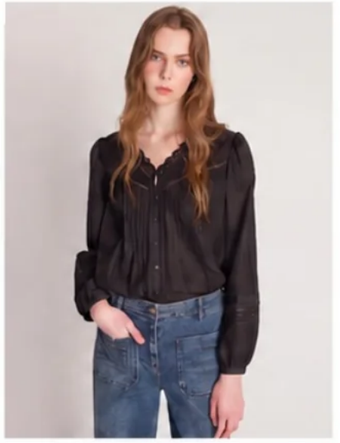

New sleeves, without redrawing the sketch

When the short puff sleeves became long sleeves,
I had AI update only what changed in the sketch and instructions.
Before and after garments are shown alongside.

01 Before
Original sketch and fit. Short puff sleeve, sleeve length 24¼″

02 After
AI-edited sketch and fit. Long sleeve, sleeve length 31″, pintucks and lace repositioned

What I did
Decided how much the sleeve and details should change, then briefed it as a prompt along with the existing design.

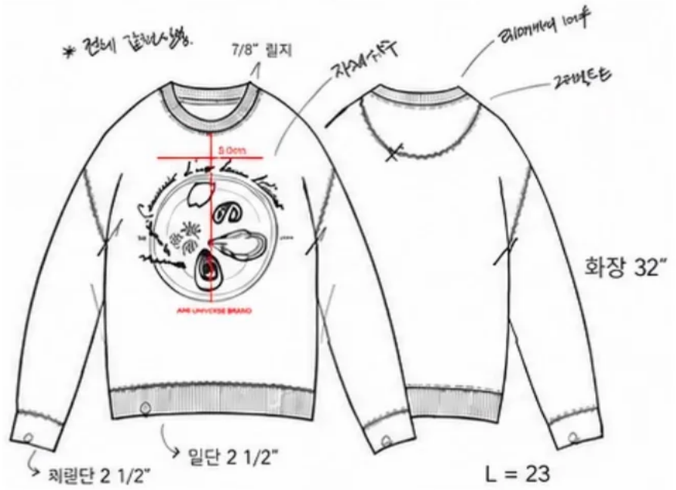

What AI handled
Edited only the changed areas, from measurements to pintuck and lace notes.

Outcome
No redrawing from scratch.
The prompt took about 20 seconds to write, not counting generation and review.

Texture review.

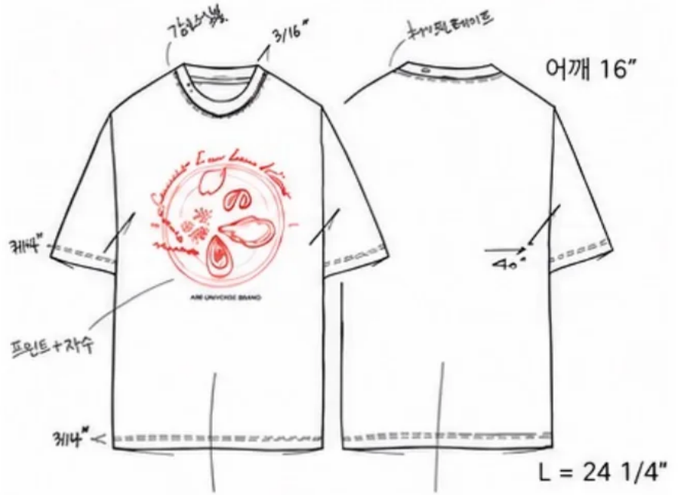

Embroidery or print, fabric by fabric

After creating the graphic in Illustrator, I previewed it as embroidery and chose the right technique for each fabric.

01 Sweatshirt, full embroidery
Heavy fleece, fully embroidered for a firm, raised finish

02 T-shirt, print + partial embroidery
Soft print on 30s jersey, with embroidery for added depth

What I did
Developed the graphic in Illustrator and chose the technique for each fabric.

What AI handled
Generated embroidery simulations to check texture and depth before sampling.

Tech pack
The silhouette stayed the same, so my hand-drawn sketches went straight into the final tech pack.

Graphic artwork.

Original artwork, with texture as the accent

I developed every graphic in Illustrator, then chose print, embroidery and hotfix finishes as design elements to suit each piece.

01 Full embroidery

02 Rubber print + partial embroidery

03 Rubber, silicone + flock print

04 All-over rubber print

05 Digital print + rubber print

06 Digital print + hotfix details

What I did
Developed the graphic artwork in Illustrator and picked the texture techniques that suited each design.
